

Tensi Drawing Extraction — Proof of Concept

Product Requirements Document

Version: 1.4
Date: March 2026
Classification: Internal
Purpose: POC to validate AI-powered metadata extraction from construction drawing PDFs before production deployment

1. Overview

Build a local, web-based application that allows a user to upload construction drawing PDFs, automatically extract metadata from each drawing using a hybrid AI pipeline, review extracted results in a table, manually correct errors, and track extraction performance over time.

This is a proof of concept — not a production system. The goal is to validate the extraction approach, test accuracy across different architect templates, and identify gaps before committing to a production build.

The app runs locally. No cloud deployment required. All data stays on the local machine.

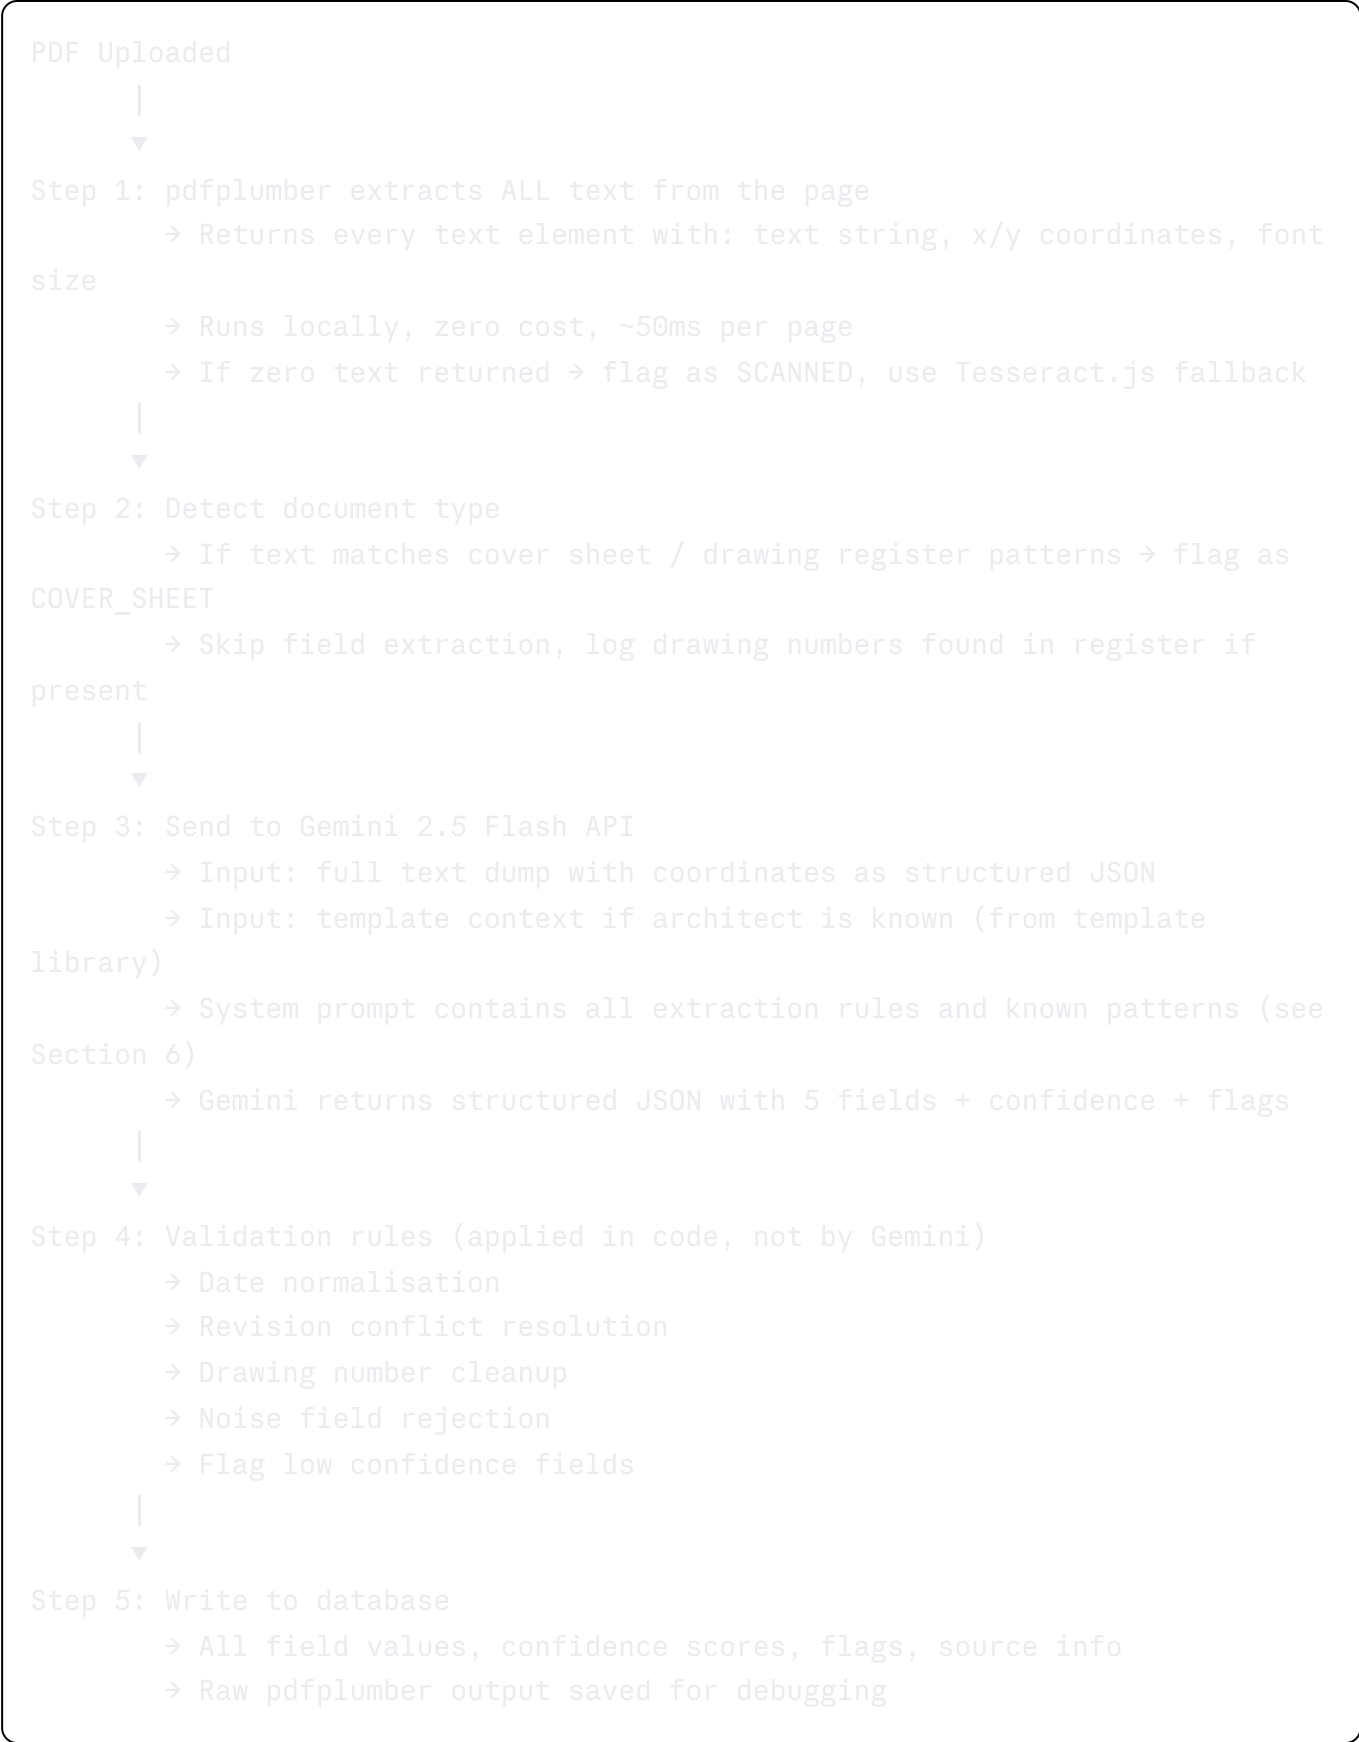

Note on tooling: Claude Code is used solely as the coding and build tool. It is not involved in extraction at runtime. All AI extraction is handled by pdfplumber (text extraction) and the Gemini 2.5 Flash API (field identification and structuring).

2. Tech Stack

Layer	Choice	Reason
Frontend	Next.js (App Router) + Tailwind CSS	Fast to build, easy to run locally
Backend	Next.js API routes	No separate server needed
Database	SQLite via Prisma	Zero config, local, persistent
PDF storage	Local filesystem (<code>/uploads</code> folder)	Simple, no external storage needed
Text extraction	pdfplumber (Python) via <code>child_process</code>	Extracts all text with x/y coordinates from born-digital PDFs — zero cost, runs locally
AI field structuring	Google Gemini 2.5 Flash API	Receives extracted text + coordinates, maps them to structured fields
OCR fallback	Tesseract.js	For scanned PDFs where pdfplumber returns no text
Build tool	Claude Code	Coding and scaffolding only — not involved at runtime
Version control	GitHub	All code pushed to repo

Why no AWS Textract or Mistral OCR: All known drawings are born-digital (exported from Revit/AutoCAD). The PDF text layer is embedded and machine-readable. pdfplumber extracts this directly — no cloud OCR service needed for the POC. Textract/Mistral can be added later as a fallback for scanned drawings if required.

3. Extraction Pipeline

4. Known Drawing Patterns (from real drawing corpus)

The following patterns have been observed across 17 real construction drawings from Australian architects and consultants. These must be reflected in the Gemini prompt and validation rules.

4.1 Title Block Locations

Location	Examples
Bottom full-width horizontal strip	ADP/MEL1930, Ellis Group, Law Architects, Insite A100
Bottom right compact block	Achieve Design, Bestec, Smith+Tracey
Right side vertical	TIVRA/Kairouz, Beehive/Insite M002, apt architecture
Left side vertical	Programmed Building Services (A101, A200)

4.2 Revision Block Locations

Location	Examples
Far left of title block (same horizontal strip)	Ascot/Smith+Tracey, Ellis Group, Law Architects

Location	Examples
Separate block top-left corner of drawing	Robinson Engineering, ADP
Integrated into title block (vertical list)	Insite A100 (right side), Bestec
Top of vertical title block	TIVRA/Kairouz, apt architecture
None — single revision field only	Programmed Building Services

4.3 Revision Column Order Variations

Gemini must not assume a fixed column order. It must read column headers first.

Column order	Examples
REV / DATE / DESCRIPTION / CHK	Ascot, ADP
DATE / REV / DESCRIPTION / CHK	TIVRA/Kairouz (date comes FIRST)
ISSUE / DESCRIPTION / DATE	Insite A100
ISSUE / AMENDMENT / DATE / BY	apt architecture
No headers — positional only	Robinson Engineering

4.4 Revision Code Formats

Format	Examples
Single letter	A, B, C
Letter + number	T1, P1, P2, C1, C2, C5 (most common)
Combined alpha	TA1 (apt architecture)
Issue codes	BP2, BP3, BP4, BP5, BP6, BP7 (Insite A100)
First issue, no letter assigned	# (Achieve Design) — return as "#" not null
Empty / blank	Return "-"

Note: Revision number may be labelled as Rev, Revision, Rev No, Revision No, Issue, Issue No, or Iss. All are the same field.

4.5 Revision Reading Order

Critical: Revision tables do not always read oldest-at-top. Must always determine latest by DATE, not by position.

Reading order	Examples
Top to bottom (oldest first, newest last)	Ellis Group (C1→C5), Law Architects, apt architecture
Bottom to top (newest first, oldest last)	Insite A100 (BP7 at top, BP2 at bottom)

Rule: Always sort revision rows by date to find the most recent. Do not rely on row position.

4.6 Drawing Number Formats

Format	Examples
Simple alphanumeric	ME001, M01, M000, WD1, A101
With dashes	3049-WD-A401, 1357-M1-2
With dots	0.A000

Format	Examples
Revision embedded via bullet	A000•B (the •B suffix is the revision — must be separated)
Long format	30776 (numeric only)

4.7 Status Field Patterns

Status is the most variable field. It appears in three different ways:

Pattern	Examples	How to extract
Large bold stamp — outside title block, anywhere on page	"PRELIMINARY" (Ascot), "ISSUED FOR CONSTRUCTION" (Ellis), "CONSTRUCTION" (Beehive/Insite), "FOR PRICING" (apt)	Read largest font-size text block on page that matches known status vocabulary
Dedicated STATUS field inside title block	"TENDER ISSUE" in TIVRA/Kairouz	Read value from field labelled Status, Issue, Drawing Status
Derived from revision description	"Tender Issue", "Construction Issue" in revision table last row	Extract description text from the latest revision row
NOT FOR CONSTRUCTION stamp	Law Architects, apt, multiple others	Valid status — do not discard
Absent	Programmed Building Services	Return null

Known status vocabulary (normalise to these):

- Preliminary Issue / Preliminary
- Tender Issue / For Tender / Tender Documentation
- Construction Issue / Issued for Construction / For Construction
- For Pricing / Not for Construction
- For Building Approval / BPA
- For Review / For Comment
- Superseded / Cancelled

4.8 Text to IGNORE (common noise)

Gemini must explicitly ignore these when scanning for status, revision, or drawing number:

- "@A1", "@A0", "@A3" — these are scale references, not revisions
- "REMIT VERSION: 2022" or similar version strings
- "THIS IS NOT AN INSTALLATION DOCUMENT"
- "TO BE PRINTED IN COLOUR"
- "DO NOT SCALE"
- "COPYRIGHT" notices
- "THIS DRAWING & DESIGN MUST NOT BE COPIED..."
- North point compass labels
- Scale bar text
- Grid reference letters/numbers at drawing borders

5. Cover Sheet Detection

Cover sheets / drawing registers must be detected and handled differently. Do NOT attempt to extract title block fields from a cover sheet.

Detection signals (if 2+ present → flag as COVER_SHEET):

- Drawing title contains: "Cover Sheet", "Drawing Index", "Drawing Register", "Legend of Symbols", "Schedule of Drawings", "General Notes"
- Page contains a table with columns: Drawing Number / Sheet Number + Sheet Name/Title (this is a drawing list, not a revision block)
- No drawing number field in title block (or drawing number is 0.A000, A0000, A000, M000 — typical cover sheet numbers)

When COVER_SHEET detected:

- Set extraction_status = "cover_sheet"
- Attempt to extract the drawing list table if present (drawing numbers + titles as an array)
- Do not populate the standard 5 fields
- Flag for user review

6. Gemini 2.5 Flash — System Prompt

This is the complete system prompt sent to Gemini on every standard extraction call. It is built from everything observed in the real drawing corpus.

You are a construction drawing metadata extraction engine for an Australian document management platform called Tensi.

You will receive a JSON array of text elements extracted from a construction drawing PDF. Each element has:

- "text": the string content
- "x": horizontal position on the page (pixels from left)
- "y": vertical position on the page (pixels from top)
- "size": font size (larger = more prominent)
- "page_width": total page width in pixels
- "page_height": total page height in pixels

Your job is to extract exactly five fields from this drawing:

1. drawing_number
2. drawing_title
3. revision
4. revision_date
5. status

UNDERSTANDING THE DRAWING LAYOUT

Construction drawings have two key areas:

TITLE BLOCK: A bordered rectangular area – usually at the bottom, right side, or left side of the page. Contains fields like Drawing Number, Drawing Title, Project, Scale, Date, Drawn By, and current Revision. Use x/y coordinates to identify this cluster.

REVISION BLOCK: A separate table showing the history of all revisions issued for this drawing. May appear in the top-left corner, far left of the title block, or integrated into the title block. Contains one row per revision issued, with columns such as: Rev/Issue, Description/Amendment, Date, and optionally By/Initials. Column order varies – always read the header row first.

STATUS STAMP: A large bold text block that may appear anywhere on the page – often top-right or top-centre. Common values: PRELIMINARY, ISSUED FOR CONSTRUCTION, CONSTRUCTION ISSUE, TENDER ISSUE, FOR PRICING, NOT FOR CONSTRUCTION. These are valid status values even when they appear outside the title block. Identify them by their large font size relative to other text.

EXTRACTION RULES

DRAWING NUMBER

- Find the value associated with labels: Drawing No, Drawing Number, Drg No, Dwg No, Sheet No, Sheet Number, Drawing, DRG, Ref No
- Format varies: ME001, A101, 3049-WD-A401, 1357-M1-2, 0.A000, 30776
- If the drawing number ends with •B, •C or similar bullet+letter suffix, SEPARATE the suffix – it is the revision, not part of the drawing number. Return the clean number without the suffix.
- Do not confuse project number / job number with drawing number

DRAWING TITLE

- Find the value associated with labels: Title, Drawing Title, Sheet Title, Description
- May span multiple lines – combine into a single string
- Do not include project name or address in the title

REVISION

- This is the CURRENT revision – the most recent one issued
- Check BOTH the title block AND the revision block:
 - TITLE BLOCK: Look for a field labelled: Rev, Revision, Rev No, Revision No,

Issue, Issue No, Iss, Current Issue, Current Rev

These all refer to the same field. Treat them as equivalent.

REVISION BLOCK: Find the table with revision history. Read ALL rows.

Determine the most recent row by DATE (do not assume top or bottom is latest

– sort by date). The most recent row by date is the current revision.

- If title block and revision block disagree, ALWAYS take the revision block's most recent row – it is the source of truth

- If drawing number has a bullet suffix (e.g. A000•B), extract the suffix letter as the revision

- Revision formats: single letter (A, B, C), letter+number (T1, P1, C5, BP7, TA1), number only (1, 2, 3)

- If revision field shows "#" → return "#" exactly. This means first issue, no revision letter assigned yet. Do NOT convert to null.

- If revision field is completely blank or empty → return "-"

- "@A1" is a SCALE reference – never interpret this as a revision

REVISION DATE

- Extract the date from the MOST RECENT revision row (same row as the current revision identified above)

- Normalise ALL date formats to DD/MM/YYYY:

DD/MM/YY → add century (assume 2000s)

DD.MM.YY → convert separators

DD/MM only (no year) → return as-is and set confidence to 0.6

Month YY format (e.g. "Nov 25") → convert to 01/11/2025 and set confidence to 0.7

Full text date → parse and convert

- Do not use the title block's general "Date" or "Date Drawn" field – that is the original drawing date, not the revision date

STATUS

- Check three locations in this priority order:

1. Large font-size text anywhere on the page matching known status vocabulary (font size larger than body text)

2. A dedicated field in the title block labelled: Status, Drawing Status, Issue Status, Issued For

3. The description/amendment column of the most recent revision row

- Known status vocabulary to match against:

Preliminary Issue, Preliminary, Tender Issue, For Tender, Tender Documentation, Tender Review,

Construction Issue, Issued for Construction, For Construction,

For Pricing, Not for Construction, For Building Approval, BPA,

For Review, For Comment, Coordination Issue, Design Development,

Superseded, Cancelled, Void

- IGNORE these – they look like status but are NOT:

"THIS IS NOT AN INSTALLATION DOCUMENT"

"TO BE PRINTED IN COLOUR"

"DO NOT SCALE"

"COPYRIGHT" text

Any text containing "MUST NOT BE COPIED"

Scale references containing "@A"

CRITICAL: NEVER USE THESE AS FIELD VALUES

- @A1, @A0, @A3, @A2 → these are scale notations

- "REMIT VERSION" followed by a year → this is a file version, not a revision

- North point labels, compass bearings

- Grid reference letters/numbers at page borders

- ABN numbers, ACN numbers

- Phone numbers, email addresses, street addresses

RETURNING RESULTS

Return ONLY valid JSON. No markdown, no preamble, no explanation.

If a field cannot be found, return null – do not guess or fabricate.

```
Return confidence as 0.0-1.0 for each field:
- 1.0 = found with clear label and unambiguous value
- 0.8 = found with label but minor ambiguity
- 0.6 = inferred from context without explicit label
- 0.4 = best guess, low confidence
- null fields should have confidence 0.0

Set conflict_detected to true if title block revision ≠ revision block most
recent revision.

{
  "drawing_number": "string | null",
  "drawing_title": "string | null",
  "revision": "string | null",
  "revision_date": "string | null",
  "status": "string | null",
  "confidence": {
    "drawing_number": 0.0,
    "drawing_title": 0.0,
    "revision": 0.0,
    "revision_date": 0.0,
    "status": 0.0
  },
  "conflict_detected": false,
  "conflict_detail": "string | null",
  "document_type": "drawing | cover_sheet | specification | unknown",
  "title_block_location": "bottom | bottom-right | right | left | unknown",
  "revision_block_location": "top-left | left-of-title-block | integrated |
none | unknown",
  "notes": "string | null"
}

{{TEMPLATE_CONTEXT}}
```

The `{{TEMPLATE_CONTEXT}}` placeholder is replaced at runtime with stored template data when available:

```
Known template for this architect (firm: {{FIRM_NAME}}):
- Title block location: {{TITLE_BLOCK_LOCATION}}
- Revision block location: {{REVISION_BLOCK_LOCATION}}
- Known field labels: {{FIELD_LABEL_MAP}}
- Revision column order: {{REVISION_COLUMN_ORDER}}
- Revision reading direction: {{REVISION_READING_DIRECTION}} (top-to-bottom |
bottom-to-top)
Use this context to guide your extraction. If the drawing does not match this
template, ignore the template and proceed with general rules. Note any
mismatch in the notes field.
```

7. Validation Rules (Applied in Code After Gemini Returns)

These run in your Next.js API route — not inside Gemini.

Rule	Logic
Date normalisation	Parse all common date formats to DD/MM/YYYY. If unparseable → keep raw value, set flag DATE_FORMAT_UNKNOWN
Drawing number cleanup	Strip bullet suffix if present (A000●B → drawing_number: A000, revision: B). Trim whitespace.
Revision conflict	If conflict_detected = true → log conflict_detail, set flag REVISION_CONFLICT, keep revision block value
Low confidence	Any field with confidence < 0.7 → add LOW_CONFIDENCE_{FIELD} to flags array
Missing required field	drawing_number null → add flag NEEDS_REVIEW. revision null + revision_date null → add flag NEEDS_REVIEW
Cover sheet	document_type = cover_sheet → set extraction_status = "cover_sheet", skip standard review queue
Null revision	revision = "#" → keep as "#" (first issue, no letter assigned). revision = "" or blank → return "-"
Status normalisation	Map raw status text to canonical vocabulary (e.g. "Issued for Construction" → "Construction Issue")

8. Database Schema

projects

id, name, description, created_at

architects

id, firm_name, firm_address, created_at

drawings

id, project_id, architect_id, filename, filepath, drawing_number, drawing_title, revision, revision_date, status, confidence_drawing_number, confidence_drawing_title, confidence_revision, confidence_revision_date, confidence_status, conflict_detected, conflict_detail, document_type (drawing | cover_sheet | specification | unknown), title_block_location, revision_block_location, extraction_model (gemini-2.5-flash), pdfplumber_raw (JSON – full text element array), flags (JSON array), extraction_status (pending | processing | extracted | cover_sheet | reviewed | published), notes, extracted_at, reviewed_at, published_at, created_at

corrections

id, drawing_id, field_name, original_value, corrected_value, corrected_at

templates

id, architect_id, title_block_location (bottom | bottom-right | right | left | unknown), revision_block_location (top-left | left-of-title-block | integrated | none |

```
unknown),
revision_column_order (JSON array e.g. ["rev","date","description","by"]),
revision_reading_direction (top-to-bottom | bottom-to-top),
field_label_map (JSON - maps discovered labels to canonical names),
sample_drawing_id,
last_updated
```

9. API Routes

Method	Route	Description
GET	/api/projects	List all projects
POST	/api/projects	Create project
POST	/api/projects/[id]/upload	Upload PDFs to project
POST	/api/drawings/[id]/extract	Trigger extraction on one drawing
POST	/api/projects/[id]/extract-all	Trigger extraction on all pending drawings
GET	/api/drawings/[id]	Get drawing + extracted data
PATCH	/api/drawings/[id]	Update field values (correction)
PATCH	/api/drawings/[id]/status	Update extraction status
GET	/api/templates	List all architect templates
PATCH	/api/templates/[id]	Update template
GET	/api/stats	Get extraction stats

10. UI Pages

/ — Dashboard

Project list with drawing counts and extraction status summary. Create new project button.

/projects/[id] — Project View

- Drag and drop file upload
- Drawing table with inline editing, confidence highlighting (amber < 0.7, red = null), status badges
- Cover sheets shown separately with a "Drawing Register" badge
- "Extract All" button for batch processing
- Filter by status: Pending / Needs Review / Reviewed / Published / Cover Sheet

/projects/[id]/drawings/[drawingId] — Drawing Detail

- Split view: PDF viewer left, extracted data form right
- Each field shows: value, confidence score, flag indicators
- Conflict alert banner if conflict_detected = true
- Edit any field → saves to DB, logs correction

/templates — Template Library

- List of all architect templates
- Expand each to see: title block location, revision block location, column order, field label map
- Edit all properties manually

/stats — Stats Dashboard

- Per-field accuracy and correction counts
- Per-architect performance breakdown
- Most common failure modes (which fields fail most)

/settings — Settings

- Gemini API key
- Confidence threshold for flagging (default 0.7)
- Toggle: send image alongside text to Gemini (optional fallback mode)

11. Environment Variables

```
env

GOOGLE_GEMINI_API_KEY=
GEMINI_MODEL=gemini-2.5-flash
UPLOAD_DIR=./uploads
DATABASE_URL=file:./dev.db
CONFIDENCE_THRESHOLD=0.7
ENABLE_IMAGE_FALLBACK=false
```

12. GitHub Setup

- Repo name: `tensi-extraction-poc`
- `.gitignore` must exclude: `.env`, `/uploads`, `dev.db`
- README: setup steps, how to run locally, how to configure API key
- Single Next.js app — Python pdfplumber script runs as a child process from the API route

13. Out of Scope (POC Only)

- User authentication / login
- Multi-user support
- Cloud deployment
- AWS Textract or Mistral OCR (not needed for born-digital PDFs)
- Fine-tuning or model training
- Mobile UI
- Symbols, walls, door interpretation (future phase — drawing content, not metadata)
- Integration with Procore, ACONEX, or any external DMS
- Claude API at runtime (Claude Code is build tool only)

14. Success Criteria

1. Upload 10 drawings from 3 different architect firms — all 10 return extracted metadata without manual intervention
2. Extraction accuracy on clean born-digital PDFs exceeds 85% across all five fields before corrections
3. Cover sheets are correctly detected and excluded from the standard review queue
4. Template library correctly applies a stored template to a second upload from the same architect

5. All manual corrections logged in the corrections table
 6. Stats dashboard shows per-field accuracy and correction counts
-

15. Build Order for Claude Code

Build strictly in this sequence:

1. **Scaffold** — Next.js app, Tailwind, Prisma + SQLite, folder structure, env config
 2. **Database schema** — all tables, Prisma migrations
 3. **File upload** — upload API route, local storage, file listing UI
 4. **pdfplumber script** — Python script that takes a PDF path, returns JSON array of text elements with x/y/size coordinates. Called from Next.js API route via `child_process`.
 5. **Cover sheet detection** — logic to detect drawing registers and flag them before extraction
 6. **Gemini 2.5 Flash integration** — send pdfplumber JSON to Gemini with the full system prompt from Section 6, parse response
 7. **Template context injection** — look up architect template from DB, inject into `{{TEMPLATE_CONTEXT}}` placeholder before sending to Gemini
 8. **Validation rules** — post-processing layer from Section 7 applied before DB write
 9. **Review table UI** — project view with inline editing, confidence highlighting, status badges, cover sheet badge
 10. **PDF viewer** — split view on drawing detail page
 11. **Correction logging** — write corrections to DB on field edit, update architect template `field_label_map`
 12. **Template library UI** — view and edit all architect templates
 13. **Stats dashboard** — accuracy metrics and correction counts
 14. **Settings page** — API key, confidence threshold
 15. **README** — setup and run instructions
-

Appendix A — Real Drawing Corpus Reference

The following 29 real Australian construction drawings were analysed to build the extraction rules, Gemini prompt, and validation logic in this PRD.

General note: Revision number may be labelled as Rev, Revision, Rev No, Revision No, Issue, Issue No, or Iss. All refer to the same field. Gemini must treat all these labels as equivalent when identifying the revision field.

Firm	Drawing No	Rev	Rev Date	Drawing Title	Title Block	Rev Block	Note
ADP Consulting	ME001	T1	20.12.25	Mechanical Services Legend of Symbols & General Notes	Bottom horizontal	Top-left separate	Rev 1 as Issued colour
TIVRA / C.Kairouz	M000	T1	28.03.2025	Cover Sheet, Drawing Index	Vertical right	Top of title block	DATUM before Issue
Robinson Engineering	1357-M1-2	T1	Nov 25	East Burwood Southern Pavilion Mechanical Services	Vertical right	Top-left separate	Date month no day
Law Architects	O.A000	T1	19/09/24	Cover Sheet and Drawing List	Bottom horizontal	Far left of title block	"NOT FOR CONSTRUCTION" title block
Programmed Building Svcs	A101	T1	FEB 2026	Ground Floor Air-Conditioning & Ventilation Arrangement	Vertical LEFT	None — single field	No revision month
apt architecture	A00	TA1	20.06.25	Cover Sheet	Vertical right	Top of title block	Non-revision Issue Rev; 1 stamp
Insite Architects	A100	BP7	18/06/2025	Proposed Floor and Roof Plan	Bottom horizontal	Right side of title block	New TOP - date 1
Programmed Building Svcs	A200	T1	02/09/2024	Elevations - Proposed	Vertical LEFT	None — single field	Same A101
Bestec	M-03	P1	FEB 2026	Ground Floor Air-Conditioning & Ventilation Arrangement	Bottom right	Integrated left	@A1 revision month
Ellis Group Architects	3049-WD-A401	C5	24.11.25	Internal Elevations - Kitchen	Bottom horizontal	Far left of title block	Statu title block instead
Insite / Beehive	M002	C2	01/10/2025	Mechanical Services Specifications	Vertical right	Top of title block	"CONSTRUCTION" stamp block
Smith+Tracey	A0501	P1	05.12.25	Proposed Site Plan	Vertical bottom	Small top block	Stamp
Achieve Design	WD1	#	13/12/24	Site Plan & Specifications	Bottom right	Integrated empty	# = file revision assigned not a blank "-"

Firm	Drawing No	Rev	Rev Date	Drawing Title	Title Block	Rev Block	Note
Ascot / Smith+Tracey	M01	P1	05.12.25	Mechanical Services Legend of Symbols & General Notes	Bottom horizontal	Far left	"PRE stamp block"
Crosier Scott Architects	A-315	-	02/07/2024	Proposed Details - Sheet 5	Right vertical	Right (empty table)	Revision present no re TEND bold block
Cotter Reid Architects	A0.12	T1	30/06/23	Signage Schedule	Bottom vertical	Top (DATE col before REV)	PRO field date before
Musk Architecture Studio	A 1.04	T0	14.10.2022	Floor, Roof and Plan Details	Right vertical	Top right	Dedicated field "STA date differ block revision"
RD Architecture	A.401	-	19.10.2022	Ramp Sections + Elevation	Bottom right	Left (empty)	REVI with revision CON ISSU title b
SGKS Architects	AJ06	IA1	24.04.20	Plan Details Kitchen & Amenities	Bottom right	Integrated	Non-revision FOR CON stamp block
GHD / Beon / Melbourne Water	M89/07/030	0	01.04.21	MW Solar Farms — 89EH Switchroom Legend & Lighting Schedule	Bottom horizontal	Bottom left complex	Multi block revision FOR CON stamp colour IC, JI
Bolden Masters	AW503	B	28.10.2024	Community Details - Precast Panel Type A	Bottom right	Integrated	Conf rev=1 latest (28/10 rules block CON ISSU
